

Advancing the material safety of your medical devices.

At AdvanSource Biomaterials, we recognize material selection is a critical component to the successful development of your medical design and device objectives. Our partnership commitment includes upholding the highest risk assessment of our products through rigorous processes and performance criteria in order to support these objectives.

As such, in a proactive response to industry concerns we have taken significant measures to mitigate the risk of infectious agent contamination, such as TSE and BSE, through controlled sourcing and qualified evaluation and vendor verification for all our starting materials. Through these efforts, we are proud to announce all of our materials are in compliance with the European Council Decision 1999/534/EC.

As dedicated partners in material science technology, we are committed to providing the most advanced materials with the highest levels of quality and safety to support the design and development of your medical device.

In addition to our product portfolio of polycarbonate-based urethanes, ether based elastomers, extrudable and solution-based hydrophilic materials, liquid polymers, silicone polycarbonate TPUs, and antimicrobial products, we continue to advance material technology through new product innovations and continuous improvement efforts.

ASB..reliability you can count on every step of the way.
